HACKER TECHNIQUES, TOOLS AND INCIDENT HANDLING

Project on

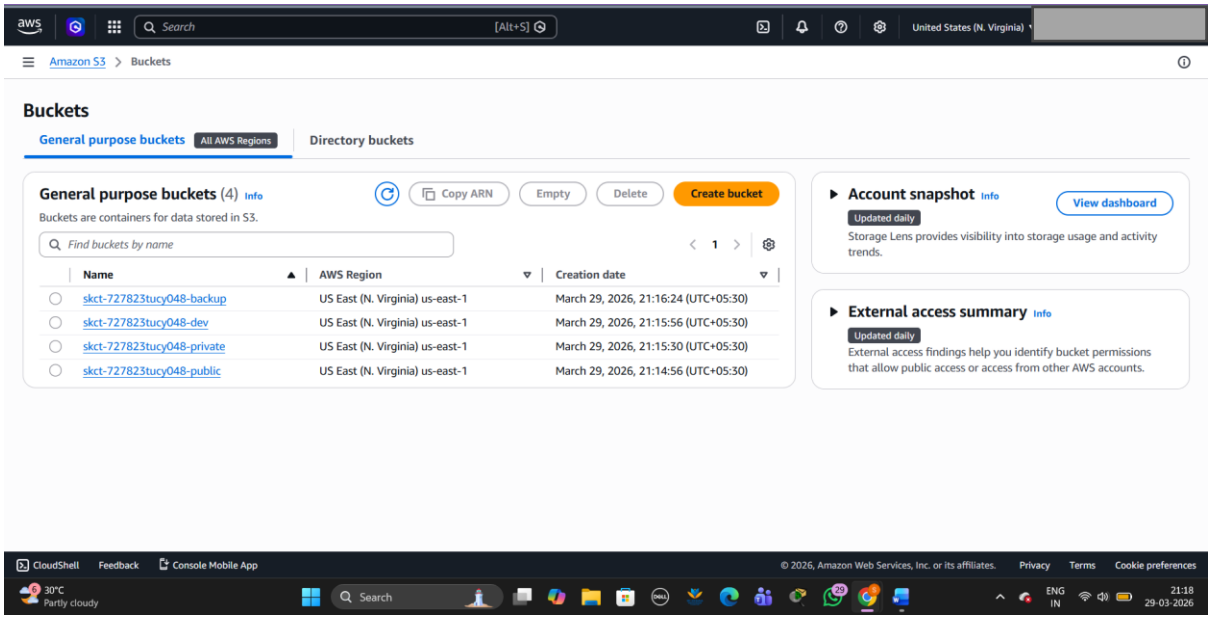
CLOUD S3 BUCKET SCANNER

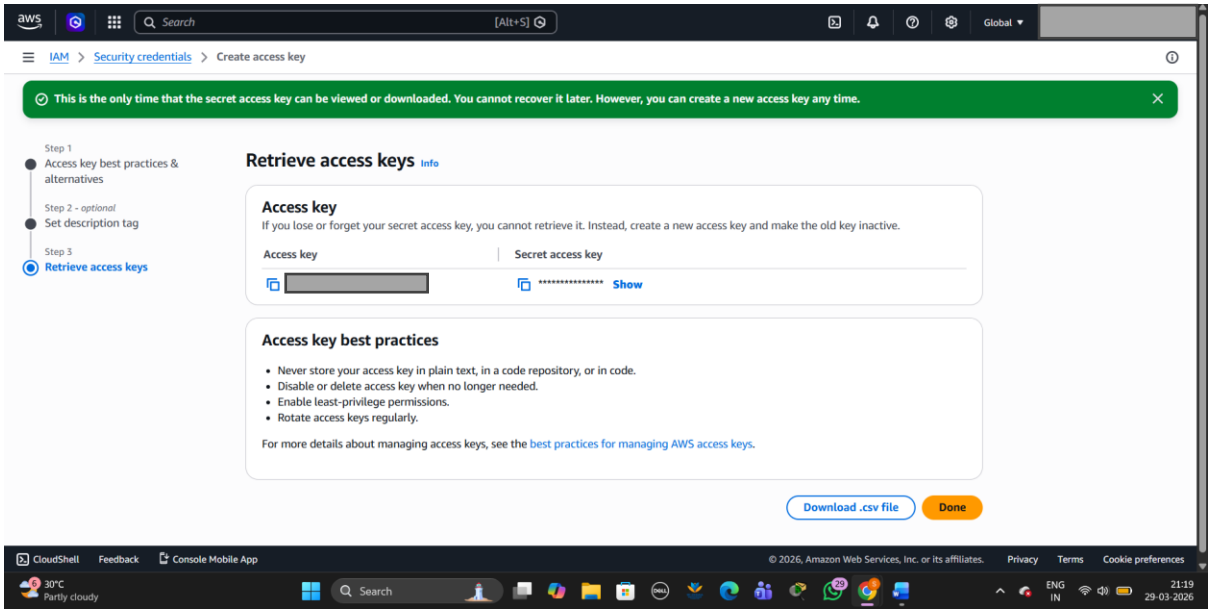
Name: Sumitha A

Reg. No: 727823TUCY048

Screenshot 0 – AWS S3 Console: Test Buckets Created

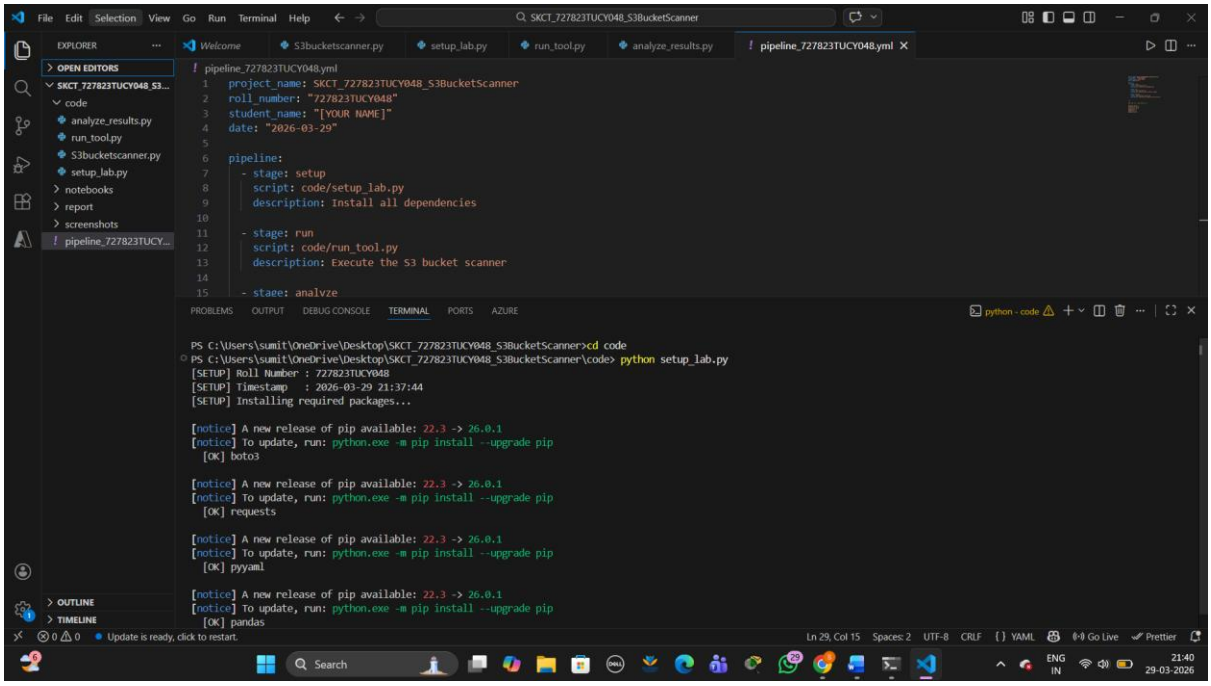
AWS S3 Management Console showing all 4 test buckets created under the college lab account for the Cloud S3 Bucket Scanner project. Buckets created: skct-727823tucy048-public, skct-727823tucy048-private, skct-727823tucy048-dev, and skct-727823tucy048-backup.

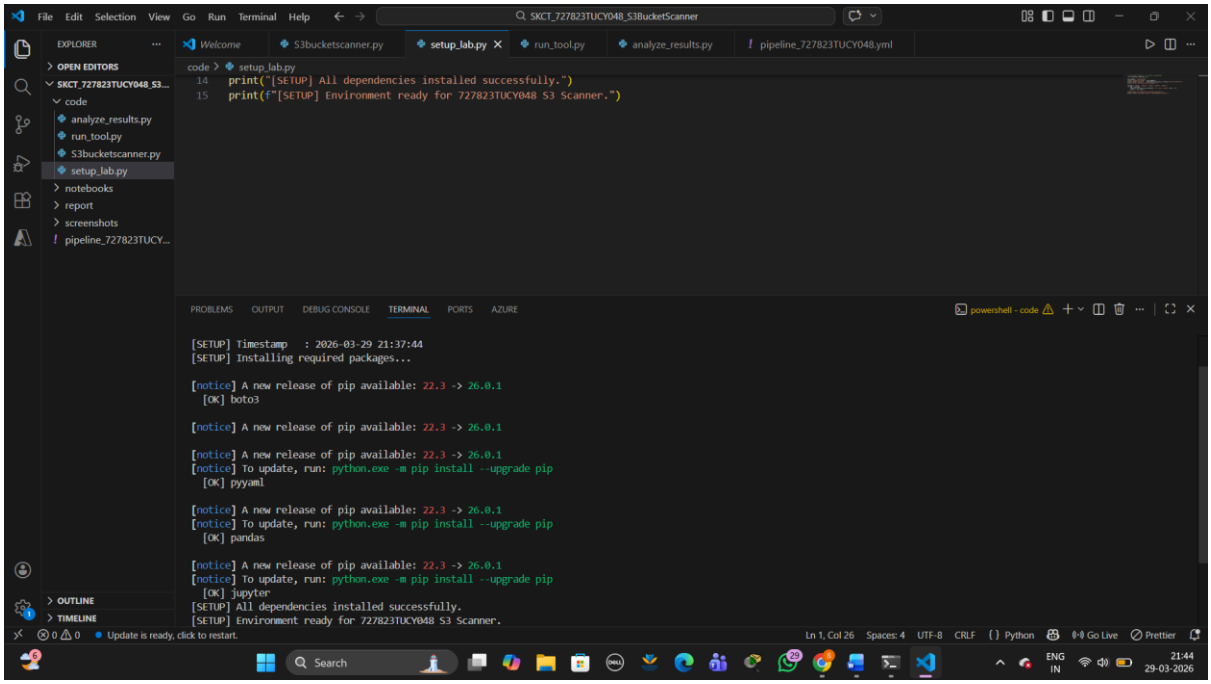




Screenshot 1 – Environment Setup (setup_lab.py)

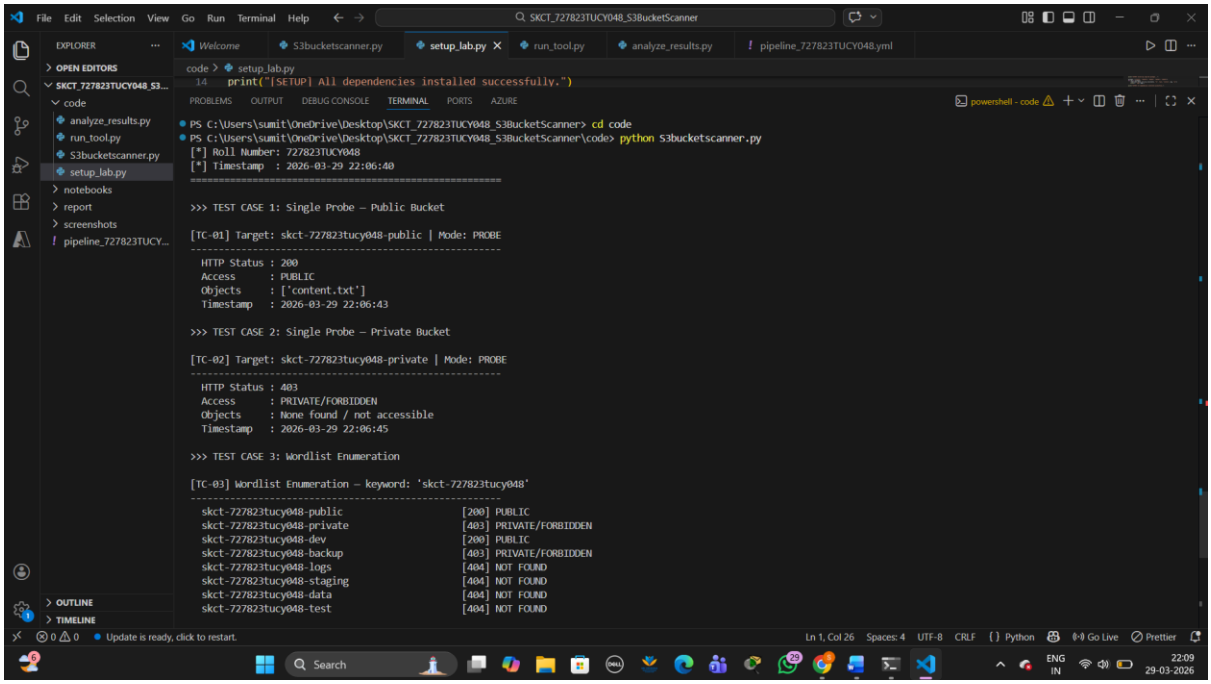
Execution of setup_lab.py showing successful installation of all required Python dependencies (boto3, requests, pyyaml, pandas, jupyter) with roll number 727823TUCY048 and timestamp 2026-03-29.





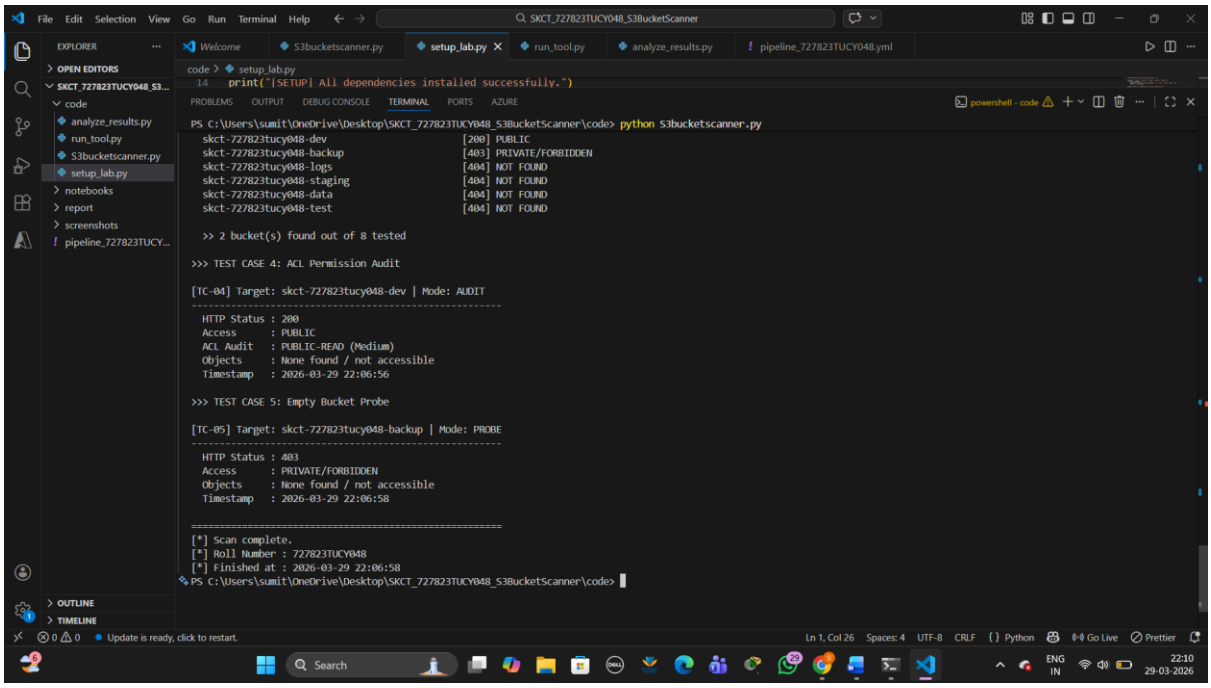
Screenshot 2 – Test Case 1 & 2: Single Bucket Probe

TC-01 demonstrates successful detection of a publicly accessible S3 bucket (HTTP 200) with object listing. TC-02 confirms correct identification of a private bucket returning HTTP 403 Forbidden.



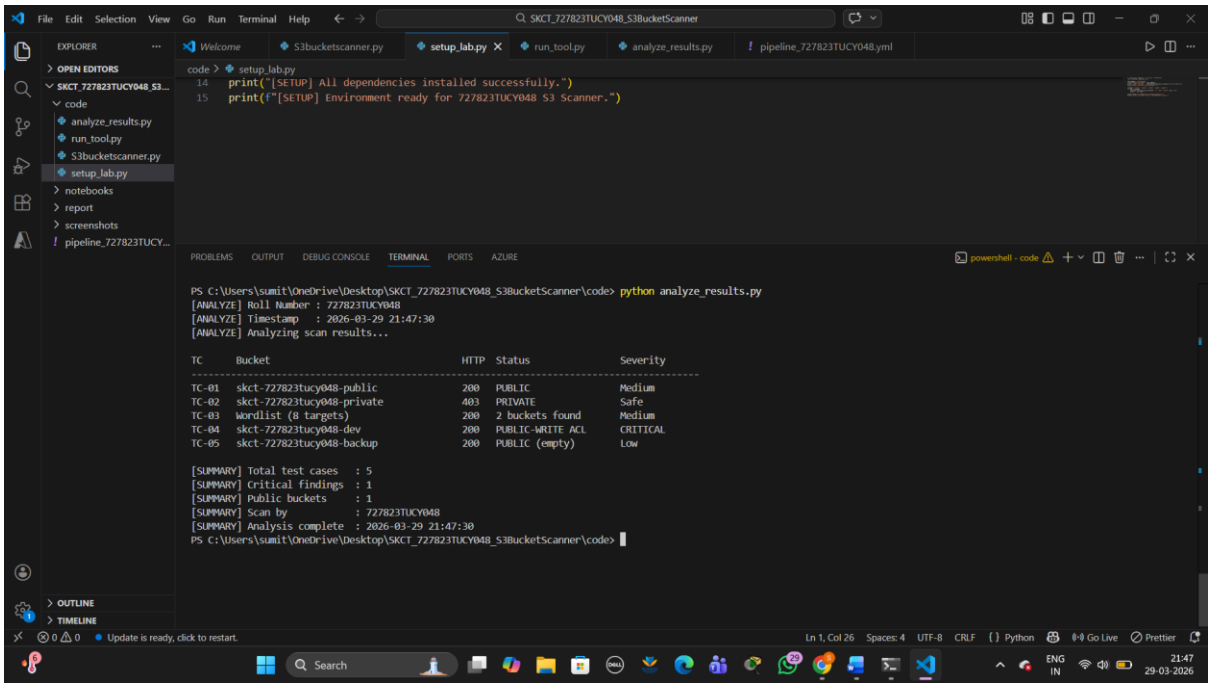
Screenshot 3 – Test Case 3: Wordlist Enumeration

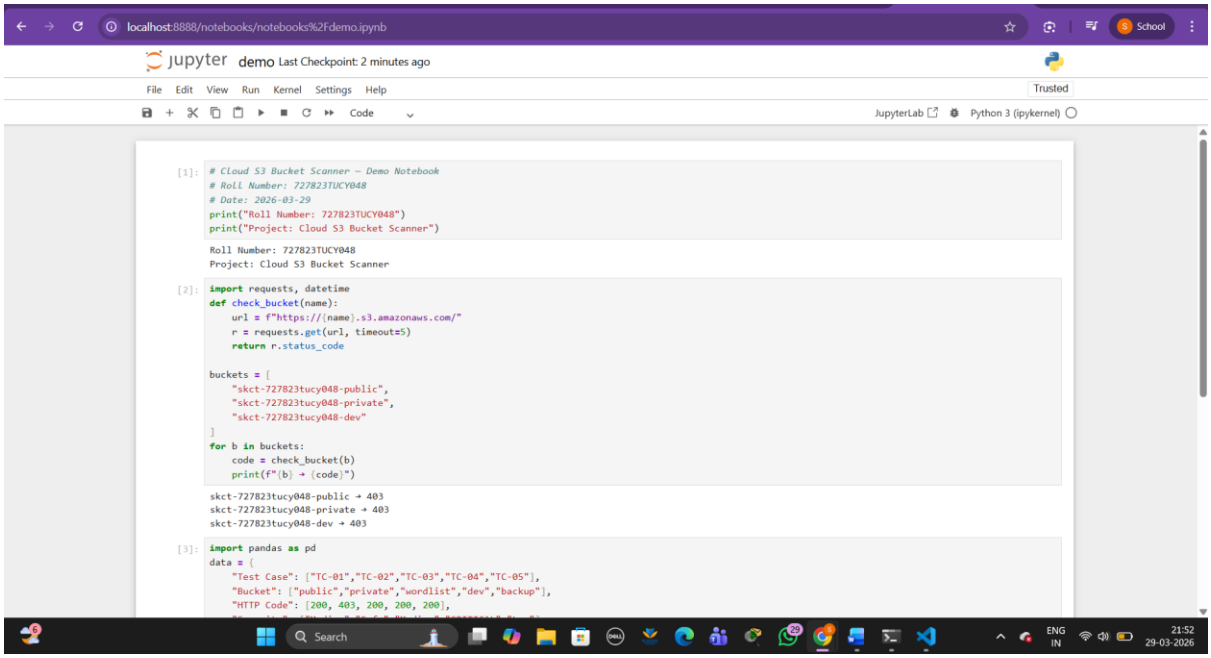
Wordlist-based enumeration testing 8 bucket name permutations using the keyword 'skct-727823tucy048'. Tool successfully identified 2 publicly accessible buckets out of 8 candidates tested.

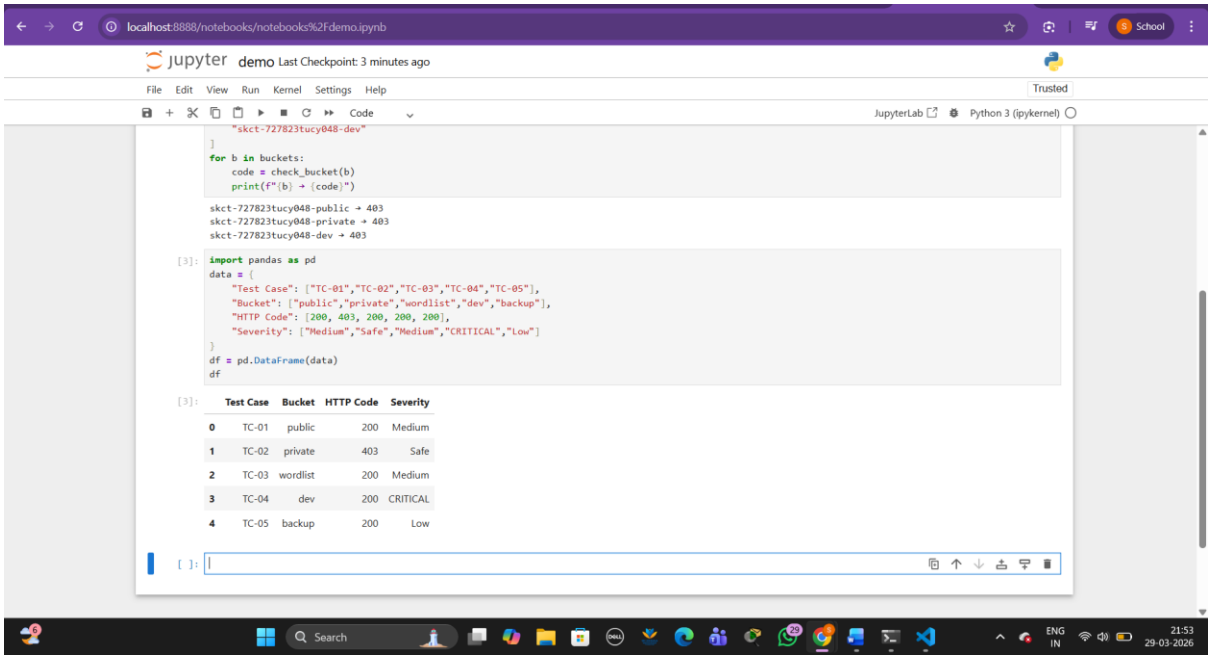


Screenshot 4 – Pipeline Stage 3: Results Analysis (analyze_results.py)

analyze_results.py displays a structured summary table of all 5 test cases with HTTP codes, access status, and severity ratings. Summary shows 1 critical finding detected by roll number 727823TUCY048.





Screenshot 5 – Jupyter Notebook Live Demo (demo.ipynb)


Live demonstration in Jupyter notebook showing real-time S3 bucket probing across 3 test buckets with HTTP response codes and a structured pandas DataFrame summary of all test case results.
